

GLOBALEDGE CONSULTING GROUP

Salesforce Event Management System

SOLUTION DESIGN DOCUMENT

Version 1.0 | Developer Org Scope | Standard Objects Approach

Prepared for	GlobalEdge Consulting Group
Platform Scope	Salesforce Developer Org (2-user)
Target Users	System Administrator, Event Manager

Version 1.1 | Prepared by Kam's Tech Talk

Note: This document has been created by Kam's Tech Talk for training and educational purposes only.

1. Executive Summary

This Solution Design Document (SDD) translates the business requirements defined in the GlobalEdge Consulting Group Event Management Use Case into a concrete Salesforce configuration plan. The design targets a free Salesforce Developer Org limited to two active users and deliberately favours standard Salesforce objects to minimise custom development, reduce ongoing maintenance overhead, and demonstrate a best-practice approach to a hiring-manager audience.

The two active personas scoped for this implementation are:

- System Administrator — responsible for configuring the platform, managing automation, and producing reports and dashboards.
- Event Manager — the primary operational user who creates events, manages registrations, tracks attendance, and coordinates communications.

The solution maps all core event management capabilities onto existing Salesforce standard objects: Campaigns (Events), Campaign Members (Registrations), Leads (B2C registrants), Contacts and Accounts (B2B delegates and companies), and Opportunities (revenue and ROI tracking). Two automated email alerts using Salesforce Flow are included to replace manual confirmation and reminder communications. Role-specific dashboards give each persona an immediately relevant view of event data without exporting to spreadsheets.

i This document is designed as a portfolio implementation guide. Each design decision is explained so that it can be discussed confidently in a technical interview context.

2. Scope & Constraints

2.1 In Scope

- Event creation and lifecycle management using Campaign standard object
- B2B registration management (Contacts + Accounts + Campaign Members)
- B2C self-registration management (Leads + Campaign Members)
- Two automated Flow-triggered email alerts: registration confirmation and 48-hour pre-event reminder
- Payment and revenue tracking using the Opportunity standard object
- Role-specific dashboards for System Administrator and Event Manager personas
- Capacity enforcement via Campaign field configuration and validation rules
- Basic post-event outcome capture (Campaign Member Status updates)

2.2 Out of Scope (Developer Org Constraints)

- Payment gateway integration (no external callouts in a free Developer Org)
- Experience Cloud portal for external self-registration (licence not included)
- Marketing Cloud or Pardot email journeys
- More than two active named users
- Mobile check-in application
- Custom Lightning Web Components

2.3 Assumptions

- A free Salesforce Developer Org is the deployment target.

- Person Accounts are enabled in the org to support B2C individual registrant records.
- All event data begins fresh — no legacy data migration is required.
- Email deliverability is configured in the Developer Org to allow test email sends.

3. User Personas

Given the two-user constraint of the Salesforce Developer Org, this design scopes two active personas. All capabilities described in the use case that would normally be served by additional personas (Sales Manager, Finance, Marketing Manager) are consolidated into the System Administrator role for the purposes of this implementation demonstration.

Persona	Primary Responsibilities	Objects Used	Dashboards
System Administrator	Platform configuration, automation management, reporting, finance/revenue oversight, post-event analysis	All objects — full access	Leadership Overview, Finance & Revenue, Full Event Portfolio
Event Manager	Create and manage event campaigns, manage registrations, monitor capacity, coordinate attendee communications, capture attendance outcomes	Campaigns, Campaign Members, Contacts, Leads, Accounts	Event Operations Dashboard, Attendance Tracker

4. Data Model — Standard Object Mapping

The following section maps each event management concept to its corresponding Salesforce standard object. No custom objects are introduced. Where standard fields are insufficient, custom fields are added to standard objects — a far lighter-weight approach than creating custom objects.

4.1 Object Overview

Business Concept	Salesforce Standard Object	Rationale
Event	Campaign	Campaigns are purpose-built for managing programmes of engagement — they hold capacity, type, status, start/end dates, and budgeted/actual costs out of the box.
Registration	Campaign Member	Campaign Member is the junction between an event (Campaign) and an attendee (Lead or Contact). Member Status drives the registration lifecycle.
B2C Registrant (individual)	Lead	Leads represent individuals who have not yet been qualified as

		clients. B2C self-registrants map naturally here — they are individuals expressing interest.
B2C Registrant (qualified individual)	Person Account (Contact)	Once a B2C registrant converts or is a known customer, they exist as a Person Account — an Account and Contact merged into a single individual record.
B2B Delegate (individual)	Contact	Contacts represent individuals associated with a company. B2B delegates are employees of partner or client Accounts.
B2B Company / Partner	Account	Accounts hold the company-level relationship, billing contact, partner tier, and group booking context.
Event Revenue / Invoice	Opportunity	Opportunities track expected and actual revenue per event booking. A B2B group booking becomes a single Opportunity linked to the Account.
Post-Event Follow-Up Task	Task (Activity)	Standard Tasks are created by Flow automation post-event and assigned to the Event Manager for follow-up actions.

4.2 Campaign Object — Event Record

The Campaign object stores all event-level information. The following custom fields supplement the standard Campaign fields to meet GlobalEdge requirements.

Field Label	Field Type	Standard / Custom	Purpose
Campaign Name	Text	Standard	Event title
Type	Picklist	Standard	B2B Conference, B2C Webinar, B2B Workshop, B2B Partner Summit, B2C Training, Supplier Briefing
Status	Picklist	Standard	Planning, Open for Registration, Closed, Completed, Cancelled
Start Date	Date	Standard	Event date/time
End Date	Date	Standard	End of event
Expected Revenue	Currency	Standard	Budgeted event revenue
Budgeted Cost	Currency	Standard	Planned cost of event delivery
Actual Cost	Currency	Standard	Actual cost incurred — used for ROI reporting

Maximum Registrations (Capacity)	Number	Standard (Expected Responses)	Total available places. Validation rule fires when Campaign Members reach this limit.
Event Format	Picklist	Custom	In-Person, Virtual, Hybrid
Event Audience	Picklist	Custom	B2B, B2C, Mixed — drives Flow branching for communication templates
Location / Virtual Link	Text Area	Custom	Venue address or virtual meeting URL included in email alerts
Registration Deadline	Date	Custom	Controls when registration is closed. Flow checks this before allowing new Campaign Members.
Max Delegates Per Company	Number	Custom	B2B only — used in validation rule to limit delegates per Account
Event Confirmed Registrations	Roll-Up Summary	Custom (Roll-Up)	Count of Campaign Members with Status = Confirmed — real-time capacity indicator

4.3 Campaign Member Object — Registration Record

Each Campaign Member record represents a single registration. Member Status values define the registration lifecycle and drive Flow automation.

Member Status Value	Trigger Point	Description / Action
Pending	On creation	Default status when a registration is first created. No confirmation email sent yet.
Confirmed	Status updated to Confirmed	Registration accepted. Flow triggers Confirmation Email Alert to the registrant.
Waitlisted	Capacity reached	Assigned automatically when confirmed count equals capacity. Registrant notified they are on the waitlist.
Cancelled	Registrant or manager cancels	Registration cancelled. If capacity was reached, Flow promotes the next Waitlisted member to Confirmed.
Attended	Post-event update	Event Manager manually updates (or bulk updates via List View) after the event.
No Show	Post-event update	Registered but did not attend. Flags for follow-up task creation.

Custom fields added to Campaign Member:

Field Label	Field Type	Purpose
Registration Date	Date/Time	Automatically stamped by Flow on record creation.
Payment Status	Picklist	Not Required, Pending Payment, Payment Received, Overdue, Refunded — used for paid events
Payment Amount	Currency	Amount due for this registration
Invoice Reference	Text	B2B only — links to the Opportunity / invoice number
Special Requirements	Text Area	Dietary, accessibility, or other attendee requirements
Feedback Score	Number (1–5)	Post-event survey rating captured by Event Manager
Feedback Comments	Text Area (Long)	Free-text post-event feedback

4.4 Lead Object — B2C Registrant

Leads represent individuals who register for B2C public events and are not yet associated with a company account. They are added as Campaign Members directly from the Lead record.

- Standard Lead fields used: First Name, Last Name, Email, Phone, Company (set to 'Individual' for sole registrants), Lead Source (set to 'Event').
- Custom field added — Event Interest (Multi-Select Picklist): captures which event types the individual has registered for, enabling future targeted invitations.
- Lead Status values configured: New, Contacted, Registered — Attending, Attended — Follow-Up Required, Converted, Disqualified.
- Leads who attend a B2C event and demonstrate high interest are manually converted to Contacts/Person Accounts by the Event Manager, creating an Opportunity to track follow-up revenue.

4.5 Contact & Account Objects — B2B Delegates and Companies

For B2B events, individual delegates are Contact records associated with their employer Account. Group bookings are managed at the Account level.

- Contact fields used: First Name, Last Name, Email, Phone, Title, Account Name.
- Custom field on Contact — Partner Tier (Picklist: Gold, Platinum, Strategic, Standard) — used as filter criteria for targeted B2B event invitations.
- Custom field on Account — Max Event Delegates (Number) — default value populated from the Campaign's Max Delegates Per Company field and used in the capacity validation rule.
- Custom field on Account — Account Type (Picklist: Client, Technology Partner, Supplier, Contractor) — used to segment B2B invitation lists.
- A roll-up summary field on Account counts active (Confirmed) Campaign Members across B2B campaigns to provide an account-level engagement score visible to the Event Manager.

4.6 Opportunity Object — Revenue & Invoice Tracking

Opportunities are used to track the commercial value of event bookings, particularly for B2B paid events and for post-event pipeline created from B2C attendance.

Use Case	Opportunity Type	Detail
B2B Group Booking (Paid Event)	Event Booking	One Opportunity per Account per paid event. Linked to the Campaign via a lookup field. Amount = total invoice value for all delegates from that company.
B2C Post-Event Follow-Up	Inbound Lead — Event Up	Created manually or by Flow when a Lead's status is updated to Attended — Follow-Up Required. Represents potential revenue from a high-engagement B2C attendee.
B2B Post-Event Upsell	Upsell / Renewal	Created by Event Manager following account-level follow-up after a B2B event. Linked to the Account and relevant Campaign.

Custom field on Opportunity: Related Campaign (Lookup to Campaign) — links the Opportunity directly to the event, enabling ROI reporting in dashboards.

4.7 Person Accounts — B2C Individuals

Person Accounts merge Account and Contact into a single record, making them ideal for B2C individual registrants who need to be tracked as customers rather than unqualified leads.

- Person Accounts are used when a B2C registrant converts from a Lead — for example, after attending an event and becoming a known customer or paid subscriber.
- Person Account records can be added as Campaign Members directly (using the underlying Contact ID), enabling the same Campaign Member lifecycle as standard B2B contacts.
- This approach means B2C individuals who mature into ongoing customers exist as first-class CRM records rather than perpetual Leads.

i Developer Org note: Person Accounts must be enabled by Salesforce Support for Developer Orgs — this is a one-time configuration request submitted via the Salesforce Help portal. Once enabled, it cannot be disabled, so this decision should be made consciously.

5. Automation Design — Salesforce Flow

Two email alert automations are built using Salesforce Flow. Both flows are Record-Triggered Flows — the most commonly used and most powerful flow type in modern Salesforce implementations. This section describes each flow in sufficient detail to build and discuss in an interview context.

i Email Alert actions used in both flows are built using Salesforce Email Alerts (Setup > Email Alerts), which reference Email Templates (Classic or Lightning). This is the recommended approach for maintainability — templates can be updated without editing the flow.

5.1 Flow 1 — Registration Confirmation Email Alert

Trigger

Object: Campaign Member

Trigger: A Record is Created or Updated

Entry Condition: Campaign Member Status EQUALS Confirmed AND Campaign Member Status CHANGED (is changed = true)

Optimisation: Run only when the status field changes to Confirmed, not on every save.

Flow Path

1. Trigger fires when a Campaign Member's Status changes to Confirmed.
2. Get Records — retrieve the related Campaign record (the Event) using {\$Record.CampaignId} to pull in Event Name, Start Date, Location/Virtual Link, and Event Audience.
3. Decision Element — branch on Campaign's Event Audience field:
 - Branch A: Event Audience = B2B → Send Email Alert using B2B Confirmation Email Template
 - Branch B: Event Audience = B2C → Send Email Alert using B2C Confirmation Email Template
 - Branch C: Event Audience = Mixed → Send Email Alert using Generic Confirmation Template
4. Send Email Alert action on each branch — the Email Alert is pre-configured with the correct template and recipient (Campaign Member's email).
5. Update Records — stamp {\$Record.Registration_Date__c} with NOW() on the Campaign Member record.

Email Template — B2B Confirmation

Subject: Your Registration is Confirmed — {!Campaign.Name}

Body includes: delegate name, event name, date, location or virtual link, company name, account manager name, joining instructions placeholder, and a note that a corporate invoice will follow where applicable.

Email Template — B2C Confirmation

Subject: You're Registered! — {!Campaign.Name}

Body includes: registrant first name, event name, date, location or virtual link, payment confirmation (if applicable), and a calendar invite prompt.

5.2 Flow 2 — Pre-Event Reminder Email Alert (48 Hours Before)

Trigger

Object: Campaign

Trigger: A Record is Updated (Scheduled-Triggered Flow or Time-Based Flow Action)

Approach: This flow uses a Scheduled Path within a Record-Triggered Flow on the Campaign object. When a Campaign's Status is set to Open for Registration, a scheduled path fires 48 hours before the Campaign's Start Date.

Flow Path

6. Trigger: Campaign Status changes to Open for Registration (entry condition).
7. Scheduled Path: Set to -48 hours before {!Campaign.StartDate}.
8. Get Related Records — retrieve all Campaign Members associated with this Campaign where Status EQUALS Confirmed.
9. Loop — iterate over each confirmed Campaign Member.

10. Inside Loop — Get the related Contact or Lead email address from the Campaign Member record.
11. Decision Element — branch on Campaign's Event Audience:
 - B2B branch → Send Email Alert using B2B Reminder Template
 - B2C branch → Send Email Alert using B2C Reminder Template
12. After Loop completes — optionally create a Task assigned to the Event Manager to confirm final logistics.

Email Template — Reminder

Subject: Reminder: {!Campaign.Name} is Tomorrow — Here's What You Need to Know

Body includes: attendee name, event name, date and start time, venue address or virtual meeting URL (from Location/Virtual Link field), agenda summary, contact details for queries.

i Interview tip: The Scheduled Path approach is preferred over a separate Scheduled Flow because it ties the reminder directly to the event record's lifecycle. If the event is postponed and the Start Date changes, the scheduled path re-evaluates automatically — a separate Scheduled Flow would need to be manually cancelled and re-run.

6. Validation Rules

Three validation rules enforce business logic that cannot be managed by Flow alone.

Rule Name	Object	Logic & Error Message
Enforce_Event_Capacity	Campaign Member	Fires on insert when Campaign.Event_Confirmed_Registrations__c >= Campaign.Expected_Responses AND ISPICKVAL(Status, 'Confirmed'). Error: 'This event has reached its maximum capacity. Please contact the Event Manager to join the waitlist.'
Enforce_Delegate_Limit_Per_Company	Campaign Member (B2B)	Fires when the count of Confirmed Campaign Members from the same Account on the same Campaign exceeds Campaign.Max_Delegates_Per_Company__c. Uses a VLOOKUP or Flow-set field. Error: 'Your organisation has reached the maximum number of delegates for this event.'
Prevent_Registration_After_Deadline	Campaign Member	Fires on insert when Campaign.Registration_Deadline__c < TODAY(). Error: 'Registration for this event closed on [date]. Please contact us if you believe this is an error.'

7. Reports and Dashboards

7.1 Report Types Required

The following custom report types are created to enable cross-object reporting:

Report Type Name	Primary Object + Related	Used For
Campaigns with Campaign Members	Campaign → Campaign Members	Registration counts, capacity, attendance rates, payment status
Campaign Members with Contacts	Campaign Member → Contact → Account	B2B delegate lists, company-level engagement
Campaign Members with Leads	Campaign Member → Lead	B2C registrant lists, lead source analysis
Campaigns with Opportunities	Campaign → Opportunities	Event ROI, revenue per event, pipeline attribution

7.2 Event Manager Dashboard — Event Operations

This dashboard gives the Event Manager a real-time operational view of all active and upcoming events.

- Component 1 — Gauge Chart: Registrations vs Capacity for each upcoming event (Campaign Expected Responses vs Confirmed Campaign Members). Alerts when above 80% full.
- Component 2 — Table: Upcoming Events list showing Event Name, Date, Format, Status, Confirmed Count, Waitlisted Count, Capacity Remaining, sorted by Start Date.
- Component 3 — Donut Chart: Registration status breakdown (Confirmed, Waitlisted, Cancelled) for events in the current month.
- Component 4 — Table: Outstanding Payment Registrations — Campaign Members where Payment Status = Pending Payment or Overdue, grouped by event.
- Component 5 — Bar Chart: Post-Event Attendance Rate — confirmed registrations vs actual attendees, by event, for events in the last 90 days.

7.3 System Administrator Dashboard — Leadership Overview

This dashboard gives the System Administrator a strategic view across the entire event programme, including revenue, ROI, and B2B vs B2C performance.

- Component 1 — Metric: Total events delivered year-to-date (Campaign Status = Completed).
- Component 2 — Metric: Total confirmed registrations year-to-date across all campaigns.
- Component 3 — Bar Chart: B2B vs B2C event registration volume by month — allows trend comparison across audience types.
- Component 4 — Table: Event ROI Summary — Campaign Name, Budgeted Cost, Actual Cost, Expected Revenue, Actual Revenue (from linked Opportunities), calculated ROI percentage.
- Component 5 — Funnel Chart: Event engagement pipeline — Invited > Registered > Confirmed > Attended > Follow-Up Created.
- Component 6 — Table: Top 10 Accounts by Event Engagement — Accounts with most Confirmed Campaign Member registrations across all B2B events.

8. Security Model

In a two-user Developer Org, the security model is necessarily simple. The design nonetheless establishes correct foundations that would scale in a full production implementation.

Layer	Setting	Detail
Organisation-Wide Defaults (OWD)	Private (Accounts, Contacts); Public Read/Write (Campaigns)	Campaigns (Events) are visible to all internal users. Account and Contact data is controlled. In a larger org, Sharing Rules would grant access where needed.
Profiles	System Administrator Profile; Custom — Event Manager Profile	System Administrator: full access. Event Manager Profile: Read/Write on Campaigns, Campaign Members, Contacts, Leads, Accounts (no delete); Read-Only on Opportunities.
Field-Level Security	Restrict sensitive financial fields	Payment Amount and Invoice Reference fields on Campaign Member are hidden from the Event Manager Profile. System Administrator has full access to all fields.
Record Types	None required (two-user scope)	In a production org, separate Record Types for B2B Event and B2C Event on the Campaign object would enforce different page layouts and picklist values per event type.

9. Implementation Configuration Steps

The following ordered steps define how to build this solution in the Developer Org. Each step is listed in dependency order — earlier steps must be completed before later ones.

Phase 1 — Org Preparation

13. Enable Person Accounts via Salesforce Support request (allow 24 hours).
14. Configure email deliverability: Setup > Deliverability > set Access Level to All Email.
15. Create the Event Manager user (second of the two available user licences). Assign the System Administrator profile temporarily for setup, then assign the custom Event Manager profile once it is created.
16. Enable Campaign Member Status customisation: Setup > Campaigns > enable Member Status customisation.

Phase 2 — Object Configuration

17. Create all custom fields on Campaign (Event Format, Event Audience, Location/Virtual Link, Registration Deadline, Max Delegates Per Company, Event Confirmed Registrations roll-up summary).
18. Configure Campaign Member Status values: Pending, Confirmed, Waitlisted, Cancelled, Attended, No Show.
19. Create custom fields on Campaign Member (Registration Date, Payment Status, Payment Amount, Invoice Reference, Special Requirements, Feedback Score, Feedback Comments).
20. Create custom fields on Contact (Partner Tier) and Account (Account Type, Max Event Delegates).
21. Create custom field on Opportunity (Related Campaign — Lookup to Campaign).
22. Configure Campaign Type picklist values: B2B Conference, B2C Webinar, B2B Workshop, B2B Partner Summit, B2C Training, Supplier Briefing.

Phase 3 — Validation Rules

23. Build and activate Enforce_Event_Capacity validation rule on Campaign Member.
24. Build and activate Prevent_Registration_After_Deadline validation rule on Campaign Member.
25. Build and activate Enforce_Delegate_Limit_Per_Company validation rule on Campaign Member.

Phase 4 — Email Templates and Alerts

26. Create four Lightning Email Templates: B2B Confirmation, B2C Confirmation, B2B Reminder, B2C Reminder (Setup > Email Templates).
27. Create corresponding Email Alerts (Setup > Email Alerts): one per template, recipient set to Campaign Member email address.

Phase 5 — Flow Automation

28. Build Flow 1 — Registration Confirmation Alert (Record-Triggered Flow on Campaign Member).
29. Activate Flow 1 and test by creating a Campaign Member with Status = Confirmed.
30. Build Flow 2 — Pre-Event Reminder Alert (Record-Triggered Flow with Scheduled Path on Campaign).
31. Activate Flow 2 and test using a Campaign with a Start Date 48 hours in the future.

Phase 6 — Reports, Dashboards, and Page Layouts

32. Create custom Report Types (Campaigns with Campaign Members, Campaign Members with Contacts, etc.).
33. Build all reports referenced in Section 7.
34. Build Event Manager Dashboard and System Administrator Dashboard.
35. Customise Campaign and Campaign Member page layouts: add custom fields to relevant sections, remove irrelevant standard fields, add related lists.
36. Set default dashboard for each user profile.

10. Testing Scenarios

The following test scenarios validate that the solution meets the core business requirements. Each scenario should be executed in the Developer Org before signing off the implementation.

#	Scenario	Steps	Expected Result
1	B2C registration confirmation email	Create a Lead. Add as Campaign Member to a B2C Campaign. Set Status to Confirmed.	B2C Confirmation email received by the Lead's email address within minutes. Registration Date stamped on Campaign Member.
2	B2B registration confirmation email	Create a Contact linked to an Account. Add as Campaign Member to a B2B Campaign. Set Status to Confirmed.	B2B Confirmation email received. Template shows company name and account manager details.
3	Capacity enforcement	Set Campaign Expected Responses to 2. Add 2 Confirmed Campaign	Validation rule fires with 'maximum capacity' error message. Third registration cannot be saved as Confirmed.

		Members. Attempt to add a 3rd with Status = Confirmed.	
4	Registration deadline enforcement	Set Campaign Registration Deadline to yesterday's date. Attempt to add a new Campaign Member.	Validation rule fires with registration closed error.
5	Pre-event reminder (48-hour)	Set Campaign Status to Open for Registration. Set Start Date to 48 hours from now. Wait for scheduled path to fire.	Reminder email sent to all Confirmed Campaign Members 48 hours before event start.
6	B2B delegate limit	Set Campaign Max Delegates Per Company to 2. Add 2 Confirmed delegates from the same Account. Attempt to add a 3rd.	Validation rule fires with delegate limit error for that Account.
7	Event ROI dashboard	Create a Campaign with Budgeted Cost and Actual Cost. Link an Opportunity (Closed Won) via Related Campaign field.	System Administrator Dashboard shows correct ROI calculation for the event in the Event ROI Summary component.

11. Key Design Decisions & Interview Discussion Points

This section explains the rationale behind key design choices. These talking points are designed to support confident discussion in a Salesforce Administrator interview.

Why use Campaigns for Events instead of a custom Event object?

Campaigns are the closest standard object to an 'event' in Salesforce. They support capacity (Expected Responses), cost tracking (Budgeted Cost, Actual Cost), status lifecycle, and Campaign Members out of the box. Using a custom object would require building all of these capabilities from scratch, plus building custom relationships to Leads, Contacts, and Opportunities — work that the Campaign object does natively. For a single-org implementation without a managed package, this is the most maintainable approach.

Why use Campaign Member Status rather than a custom Registration Status field?

Campaign Member Status is a configurable, per-campaign picklist built into the Campaign Member object. Salesforce Flow can respond to status changes natively using the 'field is changed' condition. Using the standard field instead of a custom field means reporting, list views, and the Salesforce mobile app all support it without additional configuration.

Why use Leads for B2C registrants rather than Contacts?

Leads are designed for individuals whose relationship with the business is unqualified — they have expressed interest but are not yet clients. A public B2C event registrant fits this profile exactly. Using Leads keeps the Contact database clean and preserves the Lead conversion process as the qualifying step for individuals who

demonstrate genuine commercial interest. Person Accounts handle the case where a B2C individual matures into an ongoing customer.

Why use Opportunities for revenue tracking rather than a custom Payment object?

Opportunities are the standard Salesforce mechanism for tracking commercial value. They integrate natively with Reports and Dashboards, support stage-based pipeline tracking, and link to Campaigns via the Primary Campaign Source field (and via the custom Related Campaign lookup added in this design). Creating a custom Payment object would replicate capability that Opportunities already provide and would not integrate with standard Salesforce revenue reporting.

Why use a Scheduled Path on a Campaign record rather than a separate Scheduled Flow for reminders?

A Scheduled Path within a Record-Triggered Flow fires relative to a field on the triggering record — in this case, the Campaign Start Date. If the event is rescheduled and the Start Date changes, Salesforce automatically re-evaluates the scheduled path against the new date. A standalone Scheduled Flow runs on a fixed schedule and would send a reminder based on the original date unless manually cancelled and recreated. The Scheduled Path approach is therefore more resilient and lower-maintenance.

12. Recommended Next Steps

37. Obtain Salesforce Developer Org and submit Person Account enable request to Salesforce Support.
38. Follow Phase 1 through Phase 6 configuration steps in Section 9, validating each phase before proceeding.
39. Execute all test scenarios in Section 10 and document results.
40. Record a short walkthrough video demonstrating the two email alert automations firing correctly — this serves as a strong portfolio artefact for job applications.
41. Extend the implementation for additional portfolio depth: add a third Flow to create a follow-up Task for the Event Manager when a Campaign Member status changes to No Show; add a report showing B2B vs B2C event comparison by registration volume and attendance rate.
42. Document any lessons learned and deviations from this design as the build progresses — this demonstrates reflective practice in interviews.

Appendix A — Glossary

Term	Definition
Campaign	Salesforce standard object used in this design to represent an Event. Holds event-level attributes including capacity, cost, dates, and status.
Campaign Member	Junction object between a Campaign and a Lead or Contact. In this design, represents a single Event Registration.
Person Account	A Salesforce Account record configured to represent an individual rather than a company. Used for B2C customers who have converted from Leads.
Record-Triggered Flow	A Salesforce Flow that fires automatically when a record is created, updated, or deleted. Used for both automation flows in this design.

Scheduled Path	A Flow element within a Record-Triggered Flow that delays action execution until a specified time relative to a date field on the record.
Validation Rule	A formula-based rule that prevents a record from being saved if specific conditions are met. Used here to enforce capacity and deadline logic.
Email Alert	A reusable automation action in Salesforce that sends a pre-defined email template to specified recipients. Called by Flow.
OWD (Org-Wide Default)	The baseline sharing setting for each object in Salesforce, defining the minimum level of access users have to records they do not own.
ROI	Return on Investment — calculated in this design as $(\text{Actual Revenue} - \text{Actual Cost}) / \text{Actual Cost}$, expressed as a percentage in dashboard reports.
