1. Executive Summary

This use case document captures the business context, problems, and requirements for an Event Management System to be built on the Salesforce platform. It covers both Business-to-Business (B2B) events — such as partner conferences, supplier briefings, and corporate workshops — and Business-to-Consumer (B2C) events — such as public webinars, investor briefings, and open training sessions for individual customers or contractors.

The document is intended for business stakeholders, project sponsors, and pre-sales teams. It does not prescribe a technical solution. Its purpose is to articulate the business need clearly enough to enable a Solution Design to be produced as a separate deliverable.

2. Company Context & Background

The following company profiles represent the types of organisations that face the challenges addressed in this use case. These are illustrative examples reflecting common real-world scenarios across different industries.

2.1 Company Profile A — Professional Services & Training Provider

Company: GlobalEdge Consulting Group

Industry: Professional Services / Corporate Training

GlobalEdge Consulting Group is a mid-to-large professional services company that runs an annual programme of 200+ business events including executive roundtables, client workshops, certification training, partner summits, and supplier briefings. Their attendees include senior executives from client companies, technology partners, and independent contractors seeking professional development credits.

Currently, events are coordinated by a team of 12 event managers across three regional offices using a combination of a third-party ticketing platform for public registrations, spreadsheets for attendee tracking, email for communications, and a separate invoicing system for payment collection. This creates significant manual overhead, data inconsistency across tools, and poor visibility for leadership across the business.

2.2 Company Profile B — Financial Services & Regulatory Events

Company: Meridian Financial Services Ltd.

Industry: Financial Services / Banking

Meridian Financial Services runs a portfolio of investor events, regulatory briefings, and compliance workshops for both institutional partners (B2B) and retail investors and individual contractors (B2C). They operate under strict data compliance requirements (GDPR) and require detailed audit trails of who attended which event, what materials were shared, and what follow-up actions were taken.

Their existing setup has no connection between event attendance records and their CRM, making post-event sales follow-up entirely reactive. Sales teams have no visibility of which contacts attended which events, preventing them from identifying warm leads or measuring event return on investment effectively.

2.3 Company Profile C — Technology Vendor & Partner Ecosystem

Company: NovaTech Solutions

Industry: SaaS / Technology

NovaTech Solutions hosts a mix of annual partner conferences (B2B), product launch webinars (B2C), hands-on technical workshops for developers, and supplier onboarding sessions. They manage a partner ecosystem of 500+ companies and a customer base of 50,000+ individual users across multiple tiers and subscription levels.

Their challenge is scale and personalisation — ensuring the right people are invited to the right events based on their account type, subscription tier, or partner level, and that post-event engagement activity is consistent, timely, and tracked. Currently this is managed manually, resulting in missed follow-ups and no reliable data on how events contribute to revenue.

3. Business Problem Statement

Across all three company profiles and many similar organisations, a consistent set of business problems has been identified. These problems span operational inefficiency, data fragmentation, poor customer experience, and limited business intelligence.

3.1 Fragmented Tools and Manual Processes

Most organisations manage events using a patchwork of disconnected tools — external ticketing platforms, shared spreadsheets, email distribution lists, and standalone invoicing systems. This results in:

- No single source of truth for attendee data, event status, or payment information
- Significant manual effort required to consolidate data after each event
- High error rates due to duplicate data entry across multiple systems
- Limited ability to scale event operations without adding headcount

3.2 Inability to Distinguish and Serve B2B vs B2C Audiences

B2B events (targeted at companies, partners, or suppliers) and B2C events (open to individual customers or contractors) have fundamentally different management requirements. Current systems treat all registrations identically, leading to:

- Inability to associate individual registrations with corporate accounts or partner tiers
- Generic communications sent regardless of whether the attendee is an enterprise contact or an individual consumer
- No way to enforce group booking rules or manage corporate delegate allowances
- Missed opportunity to use event attendance as a signal for account-level engagement and sales activity

3.3 Poor Visibility of Event Performance and ROI

Business leaders lack timely, accurate reporting on event performance. Common blind spots include:

- No real-time view of registration numbers versus available event capacity
- Revenue recognised per event cannot be easily compared against cost of delivery
- No reliable data on conversion rates from event attendance to qualified pipeline or closed deals
- Inability to compare B2B versus B2C event performance across regions or business units

3.4 Weak Pre- and Post-Event Communication

Without a connection between event management and CRM data, organisations struggle to deliver timely, relevant communications to attendees:

- Confirmation emails and joining instructions are sent manually, creating delays and inconsistency
- Post-event follow-up is not coordinated, meaning warm leads from events go cold
- Reminder sequences are inconsistent and dependent on individual team members remembering to act
- No structured mechanism exists to collect post-event feedback and link it back to contact or account records

3.5 Payment and Invoicing Complexity

For paid events, organisations face additional complexity around payment collection, particularly when managing both corporate invoicing (B2B) and individual online payments (B2C):

- No automated tracking of payment status against individual registrations
- Manual reconciliation required between event systems and the finance platform
- Difficulty managing cancellations, refunds, or partial payments at scale
- No visibility of outstanding balances linked to specific companies or individual customers

3.6 Compliance and Data Privacy Risk

Organisations operating under GDPR and similar data protection regulations face specific risks when event data is held outside their core CRM and managed in spreadsheets or third-party tools:

- Attendee personal data stored in uncontrolled spreadsheets with no audit trail
- No mechanism to honour data subject access requests or deletion requests tied to event records
- Difficulty demonstrating consent for event-related marketing communications
- Risk of data breaches due to event lists shared informally via email

4. User Personas — Who Will Use the System

The Event Management System will serve multiple internal and external user groups. Understanding their distinct needs is essential to ensure the system is designed to deliver value across all teams. The table below summarises each persona, their role, and what they need from the system.

User Persona	Role Description	What They Need from the System
Event Manager	Plans and operationally manages events end-to-end — from creation and promotion through to post-event wrap-up.	A single place to create and manage event details, monitor registrations against capacity, track attendee lists, and ensure communications are sent on time.
Sales / Account Manager	Manages client and partner relationships and uses event attendance as part of their sales and account development activity.	Clear visibility of which contacts from their accounts have registered for or attended events, so they can prioritise timely and relevant follow-up conversations.
Marketing Manager	Responsible for promoting events to the right audience and measuring the downstream impact on pipeline and revenue.	Ability to target the right contacts with event invitations, track registration conversion, and understand how event attendance connects to sales outcomes.
Finance / Billing Team	Manages payment collection, corporate invoicing, and financial reconciliation for paid events.	Clear visibility of which registrations have been paid, which are outstanding, and the ability to produce or track invoices linked to individual companies.
Partner / Supplier Manager	Oversees the participation of partner companies and suppliers in B2B events and manages their relationship with the business.	Ability to manage group registrations at the account level, enforce per-company delegate limits, and monitor partner engagement across events.
System Administrator	Responsible for configuring, maintaining, and governing the Salesforce platform on which the system is built.	Clear requirements for data model, user access rules, automation triggers, and integration points so the platform can be built and maintained effectively.
External Registrant (B2C)	An individual customer or independent contractor who self-registers for a public-facing event.	A straightforward, reliable registration experience — including confirmation, payment where applicable, and timely communications about the event.
External Delegate (B2B)	An employee nominated by a partner or client company	Clarity on the registration process, confidence that their company booking is managed correctly, and timely receipt

	to attend an event on behalf of their organisation.	of joining details and any relevant materials.
--	---	--

5. Business Capability Requirements

This section describes what the business needs the system to be able to do, grouped by capability area. These requirements are expressed at the business level and are independent of any specific technical implementation.

5.1 Event Management

The business requires a central system to create and manage event records, covering all key attributes such as the event name, type (B2B or B2C), date and time, location or virtual format, capacity, registration deadline, and pricing where applicable. The system must support events of different formats including in-person, virtual, and hybrid. Events must be linkable to marketing activity so that registration and attendance data can be tied back to campaign performance.

5.2 Registration Management

The system must support both self-service registration by individuals (B2C) and managed registration on behalf of companies or groups (B2B). Registrations must have a clear lifecycle status — such as pending, confirmed, waitlisted, attended, or cancelled — that is visible to event managers in real time. The system must enforce capacity limits automatically and manage a waitlist when an event is full. Individual registrations must be linked to the relevant contact or company record in the CRM so that a complete history of engagement is maintained.

5.3 Attendee and Capacity Management

Event managers must be able to see, at a glance, how many places remain for each upcoming event and take action when capacity thresholds are reached. For B2B events, the system should support delegate management at the company level, including the ability to set and enforce a maximum number of delegates per organisation. When a cancellation

occurs, the business requires the waitlist to be managed in a consistent and fair manner without manual intervention.

5.4 Payment and Invoicing

For paid events, the system must track payment status against each registration and provide visibility of outstanding amounts. The business requires support for two distinct payment models: individual online payment at the point of registration (typically B2C), and corporate invoice with agreed payment terms (typically B2B). The Finance team needs a consolidated view of all payment activity across events, including the ability to identify and follow up on overdue amounts. The system must integrate or connect with the organisation's finance platform to avoid manual reconciliation.

5.5 Communication Management

The system must support automated, timely communications throughout the event lifecycle, including registration confirmation, pre-event reminders, joining instructions, and post-event follow-up. Communications must be personalised to the recipient and contextually relevant — for example, B2B communications should reflect the corporate relationship and may need to be copied to the account manager or company administrator, while B2C communications should be direct and consumer-friendly. All communication history should be visible against the relevant contact record in the CRM.

5.6 Post-Event Engagement

After each event, the business requires a structured process for capturing attendance outcomes and ensuring appropriate follow-up takes place. For B2B events, this means notifying the relevant account manager and enabling them to log follow-up activity. For B2C events, this means identifying high-engagement attendees who may represent sales or marketing opportunities. The system should also support the distribution of post-event surveys and the capture of feedback against contact and event records.

5.7 Reporting and Visibility

The business requires real-time visibility of event performance at both the operational and strategic level. Operational reporting needs include current registration and capacity status, attendee lists, waitlist management, and payment tracking. Strategic reporting needs include event ROI, attendance trends over time, B2B versus B2C performance comparison,

account-level engagement scoring based on event participation, and the contribution of event activity to sales pipeline and revenue. Role-specific dashboards are required so that event managers, marketers, sales teams, and finance each have a view relevant to their responsibilities.

5.8 B2B-Specific Requirements

Events targeted at corporate clients, partners, or suppliers have a set of requirements that go beyond standard registration management:

- Registrations must be associated with both the individual attendee and their parent company or partner account
- Group bookings must be manageable at the account level, with visibility of all delegates from a single company
- The system must support per-company delegate limits with appropriate controls when limits are reached
- Corporate invoicing must be supported, with invoices linked to the company's billing contact and payment terms
- Post-event activity must trigger account-level follow-up and feed into account engagement metrics
- Partner tier or supplier category must be usable as criteria for targeted invitations

5.9 B2C-Specific Requirements

Events targeted at individual customers or independent contractors require a different set of capabilities:

- A straightforward, publicly accessible self-registration experience is required
- Individual online payment must be supported at the point of registration
- Communications must be personalised to the individual and delivered directly without requiring a corporate intermediary
- The system must support high-volume registration processing without manual intervention
- Post-event engagement should identify high-interest individuals and enable targeted follow-up by marketing or sales teams

6. How Salesforce Can Address These Business Needs

This section outlines, at a conceptual level, how the Salesforce platform is positioned to meet the business capability requirements described in Section 5. This is not a technical specification — detailed design will be addressed in the Solution Design Document.

6.1 A Single Platform for Events, Customers, and Engagement

One of the most significant challenges identified across all three company profiles is the fragmentation of data across multiple disconnected tools. Salesforce, as a CRM platform, already holds the organisation's account, contact, and opportunity data. Building the Event Management System within Salesforce means that event registrations, attendance history, payments, and follow-up activity all sit alongside — and are connected to — the existing customer and partner records. This eliminates the need for manual data reconciliation and gives every team a single, consistent view of engagement.

6.2 Support for Both B2B and B2C Event Models

Salesforce's data model is designed to support both company-level (Account) and individual-level (Contact and Lead) relationships. This makes it naturally suited to managing the distinct requirements of B2B and B2C events within a single system — associating corporate group bookings with Account records while also handling individual self-registrations from consumers or contractors. The platform can enforce different rules, communication templates, and follow-up processes depending on the event type, without requiring two separate systems.

6.3 Automation to Replace Manual Processes

Salesforce Flow, the platform's native automation capability, allows the business to define and automate processes that currently require manual intervention. Key areas where automation would be valuable include: sending confirmation and reminder communications at the right time without human input; managing the transition from waitlisted to confirmed when a cancellation occurs; creating follow-up tasks for sales teams after an event; and flagging overdue payments to the Finance team. The intent is that event managers spend their time on event quality rather than administrative coordination.

6.4 Centralised Communication Management

By managing events within Salesforce, all communications — invitations, confirmations, reminders, and post-event follow-ups — can be sent, tracked, and stored within the same

platform as the customer record. This means every team member can see what has been communicated to a contact, reducing duplication, improving consistency, and enabling more contextual conversations during sales or account management activity.

6.5 Payment Tracking and Finance Visibility

Salesforce can maintain a payment record against each registration, enabling the Finance team to track what is owed, what has been received, and what is overdue — all within the same system used by sales and event managers. For B2B events, corporate invoicing requirements can be managed at the Account level. While detailed payment processing would be handled via an integration with a payment gateway or finance system, the visibility and tracking layer sits within Salesforce, accessible to all relevant teams.

6.6 Reporting and Dashboards

Salesforce's built-in reporting and dashboard capability allows the business to create real-time views of event performance without exporting data to spreadsheets. Reports can be built to serve the needs of different teams — operational views for event managers, pipeline and attribution reports for marketing and sales, and revenue and payment summaries for finance. Dashboards can be tailored by role and updated automatically as underlying data changes, providing leadership with a live view of the event programme at any time.

7. Key Information the System Must Capture

To meet the business requirements described in this document, the system will need to capture and maintain data across a number of areas. The following outlines the categories of information the system must hold — the detailed data design will be addressed in the Solution Design Document.

Information Area	What Must Be Captured
Event Details	Name, type (B2B or B2C), date and time, location or virtual meeting details, format, capacity, registration deadline, pricing, current status, and linked marketing campaign.

Registrations	Who registered (individual and, for B2B, which company), registration date, current status (confirmed, waitlisted, cancelled, attended), ticket type, and whether a payment is required.
Attendee Information	Contact details of each attendee, their relationship to a company or account (for B2B), and any special requirements or preferences relevant to attendance.
Payment Records	Amount due per registration, payment method, payment status (pending, received, overdue), invoice reference (for B2B), and any refund or cancellation history.
Event Sessions	For multi-session or multi-track events, which sessions exist within an event and which attendees are registered for or attended each session.
Communications Sent	A record of every communication sent to a registrant — confirmation, reminders, joining instructions, post-event survey — including date sent and response where applicable.
Post-Event Outcomes	Whether each registrant actually attended, any feedback captured via post-event survey, and follow-up actions taken by the sales or account management team.
Sponsor and Partner Details	For B2B events, which companies or partners are sponsoring or co-hosting, their tier or category, and any commitments or deliverables associated with their involvement.

8. B2B vs B2C Event Management — Key Differences

One of the core requirements of this system is the ability to manage B2B and B2C events differently within a single platform. The table below summarises the key differences in business requirements between the two event types, illustrated with real-life examples from the company profiles.

Dimension	B2B Events — Business Requirements	B2C Events — Business Requirements
Who Registers	A company nominates one or more employees as delegates.	An individual customer or independent contractor registers for

	Registrations need to be associated with the company as well as the individual, and a company administrator or account manager may manage registrations on behalf of multiple delegates.	themselves. The process must be straightforward and self-service, accessible without any involvement from a company intermediary.
Invitation Process	Invitations are targeted and relationship-led — sent to named contacts within specific companies, partner tiers, or supplier categories based on their relationship with the business. The guest list is curated and controlled.	Invitations are broadcast-style — sent to a broad audience via marketing campaigns, public event listings, or social media. Registration is open to anyone who meets the eligibility criteria.
Registration Logic	Group bookings need to be manageable at the company level. The business needs to be able to set and enforce a maximum number of delegates per company, ensure the right individuals are nominated, and allow delegate substitution if someone cannot attend.	Individual registrations are independent of one another. The key requirement is a smooth, fast self-service process. Volume can be high, so the system must handle large numbers of simultaneous registrations reliably.
Payment Model	Payment is typically by corporate invoice addressed to the company's finance or accounts payable team. Payment terms (such as 30-day or 60-day) must be accommodated. Group discounts for larger delegations may apply.	Payment is typically made by the individual at the point of registration using a credit or debit card or digital payment method. Payment must be received before the registration is confirmed.
Communications	Communications need to reflect the corporate relationship — formal in tone, potentially addressed to both the delegate and their company administrator or account manager. Joining instructions may need to be sent to multiple contacts within a company.	Communications are direct to the individual registrant — personalised, clear, and consumer-friendly in tone. The registrant is the sole point of contact for all event-related information.
Post-Event Follow-Up	After the event, the account manager responsible for each attending company needs to be notified and prompted to follow up. Attendance data needs to feed into	After the event, individual attendees should receive relevant follow-up content or be identified for further engagement by marketing or sales based on their level of

	account-level engagement records so that the full picture of a client or partner relationship is visible.	participation and interest demonstrated.
Compliance and Audit	For B2B events involving regulated industries (e.g. financial services), a clear audit trail is needed of who attended, what they were told, and what materials were shared — linked to the company and individual contact record.	GDPR compliance requires clear consent for communications and the ability to manage individual data subject rights. Attendance records must be held securely and linked to the individual's contact record.

8.1 Real-Life B2B Event Example — Partner Summit

NovaTech Solutions hosts their annual Partner Summit for Gold and Platinum tier technology partners. Invitations go only to named contacts at qualifying partner companies. Each partner company is permitted to send up to three delegates. If a nominated delegate cancels, the company administrator needs to be able to substitute another colleague without losing the company's place.

After the event, NovaTech's partnership managers need to know exactly which individuals from each partner company attended, what sessions they joined, and whether any follow-up commitments were made. This information feeds into the partner renewal and commercial review process. Partners who attended but have not engaged with their account manager within a defined period should be flagged for outreach.

8.2 Real-Life B2C Event Example — Investor Webinar

Meridian Financial Services opens a free online regulatory briefing to their base of retail investors and independent contractors. Thousands of individuals may register over a short period. The registration process must be simple and immediate — individuals should receive a confirmation within minutes of signing up, with clear joining instructions and a calendar invitation.

After the event, Meridian needs to know who attended and for how long, who registered but did not attend, and what the overall engagement level was. Attendees who showed high engagement should be identified for follow-up by the investor relations team. All attendance records must be retained and linked to individual contact records in compliance with financial services data retention requirements.

9. Reporting and Visibility Requirements

The business requires reporting and dashboard capability that serves the needs of multiple teams at different levels of the organisation. The following outlines the key reporting requirements by audience — the specific report and dashboard design will be addressed in the Solution Design Document.

9.1 Event Operations — What Event Managers Need to See

- Current registration count versus total capacity for every upcoming event
- The full attendee list for any event, filterable by registration status
- How many registrations are on the waitlist and who is next in line
- Which registrations have outstanding payments
- Post-event comparison of confirmed registrations versus actual attendance

9.2 Sales and Account Management — What Sales Teams Need to See

- Which contacts from their accounts have registered for or attended events
- Which accounts have the highest level of event engagement across the programme
- Contacts who attended events but have no active sales opportunity against them
- Which events have contributed to open or closed opportunities

9.3 Marketing — What Marketing Managers Need to See

- Registration conversion rate from invitation to confirmed attendee, by event and by campaign
- Attendance rate — what proportion of registered attendees actually attended
- Post-event engagement metrics — feedback scores, survey responses, follow-up click-through rates
- How event attendance connects to pipeline creation and revenue over time
- Comparison of B2B versus B2C event performance across the portfolio

9.4 Finance — What the Finance Team Needs to See

- Total expected revenue per event versus actual payments received
- All registrations with outstanding or overdue payment balances
- Corporate invoices issued, by account, with payment status and due date

- Revenue breakdown by event type, format, and time period

9.5 Leadership and Business Intelligence

- Programme-level view of total events, registrations, and attendance across a quarter or year
- Event return on investment — revenue versus cost of delivery per event
- Trend in event engagement over time — growth or decline in registrations and attendance
- Geographic or business unit breakdown of event activity and performance

10. Scope Boundaries & Assumptions

The following boundaries and assumptions apply to this use case document. They are intended to clarify what this document addresses and what is deliberately deferred to later stages of the project.

In scope for this use case:

- Business problems, stakeholder needs, and capability requirements for an Event Management System
- Identification of the types of data the system must capture
- High-level description of how Salesforce is positioned to meet these needs
- Distinction between B2B and B2C event management requirements
- Reporting and visibility needs by user group

Out of scope for this document (to be addressed in Solution Design):

- Technical data model, object configuration, and field-level design
- Salesforce Flow logic, trigger conditions, and automation specifications
- Integration architecture with payment gateways, finance systems, or marketing platforms
- User interface design and page layout configuration
- Specific Salesforce edition, licence, or add-on recommendations
- Security model, profiles, and permission sets
- Data migration approach from legacy systems

Additional items out of scope for the system overall:

- Event mobile application for on-site attendee check-in
- Venue booking, logistics planning, and supplier procurement
- Speaker management and speaker portal
- Live event streaming or virtual event platform

Assumptions:

- The Salesforce CRM platform is the agreed target platform for this system
- The organisation's contact and account data is already held in Salesforce or will be migrated as a prerequisite
- GDPR and applicable data protection requirements will be addressed during solution design and are not detailed in this use case

11. Recommended Next Steps

To progress from use case to delivery, the following steps are recommended:

- **Stakeholder Validation:** Circulate this use case document to key stakeholders across Event Management, Marketing, Sales, Finance, and IT for review and sign-off. Capture any gaps or corrections before proceeding.
- **Discovery Workshop:** Conduct a structured discovery workshop with business representatives to validate, prioritise, and refine the requirements identified in this document. Focus particularly on confirming the B2B and B2C distinctions and any organisation-specific rules or constraints.
- **Solution Design Document:** Commission a Solution Design Document that translates the business requirements in this use case into a detailed technical specification — covering data model, automation design, integration approach, reporting configuration, and user access.
- **Proof of Concept:** Develop a limited proof of concept in a Salesforce sandbox to demonstrate the core event registration and communication flows to business stakeholders, enabling early validation of the proposed approach.
- **Phased Delivery Roadmap:** Define a phased implementation plan that delivers value incrementally — for example, beginning with core event and registration management, then adding payment integration, and finally deploying advanced reporting and marketing automation.
- **Data and Legacy Systems Assessment:** Review what event and attendee data currently exists across legacy tools and spreadsheets, and assess what needs to be migrated, consolidated, or archived before go-live.
